

Oxford Cambridge and RSA

A Level Computer Science

H446/02 Algorithms and Programming

Thursday 22 June 2017 – Morning

Time allowed: 2 hours 30 minutes

Do not use:

- A calculator

First name										
Last name										
Centre number						Candidate number				

INSTRUCTIONS

- Use black ink.
- Complete the boxes above with your name, centre number and candidate number.
- Answer **all** the questions.
- Write your answer to each question in the space provided. Additional paper may be used if required but you must clearly show your candidate number, centre number and question number(s).
- Do **not** write in the barcodes.

INFORMATION

- The total mark for this paper is **140**.
- The marks for each question are shown in brackets [].
- Quality of extended responses will be assessed in questions marked with an asterisk (*).
- This document consists of **28** pages.

Answer **all** the questions.

Section A

1 A programmer needs to sort an array of numeric data using an insertion sort.

(a) (i) The following, incomplete, algorithm performs an insertion sort.

Complete the algorithm.

```
procedure sortit(dataArray, lastIndex)
  for x = 1 to lastIndex
    currentData = dataArray[.....]
    position = x
    while (position > 0 AND dataArray[position-1] > currentData)
      dataArray[position] = dataArray[.....]
      position = position - 1
    endwhile

    dataArray[position] = .....
  next x
endprocedure
```

[3]

2 A programmer is developing an ordering system for a fast food restaurant. When a member of staff inputs an order, it is added to a linked list for completion by the chefs.

(a) Explain why a linked list is being used for the ordering system.

.....

.....

.....

..... [2]

(b) Each element in a linked list has:

- a pointer, `nodeNo`, which gives the number of that node
- the order number, `orderNo`
- a pointer, `next`, that points to the next node in the list

Fig. 2.1 shows the current contents of the linked list, `orders`.

<code>nodeNo</code>	<code>orderNo</code>	<code>next</code>
0	154	1
1	157	2
2	155	3
3	156	∅

Fig. 2.1

∅ represents a null pointer.

(i) Order 158 has been made, and needs adding to the end of the linked list.

Add the order, 158, to the linked list as shown in Fig. 2.1. Show the contents of the linked list in the following table.

<code>nodeNo</code>	<code>orderNo</code>	<code>next</code>

[2]

- (ii) Order 159 has been made. This order has a high priority and needs to be the second order in the linked list.

Add the order, 159, to the original linked list as shown in Fig. 2.1. Show the contents of the linked list in the following table.

nodeNo	orderNo	next

[3]

- (c) The linked list is implemented using a 2D array, `theOrders`:

- Row 0 stores `orderNo`
- Row 1 stores `next`

The data now stored in `theOrders` is shown in Fig. 2.2.

184	186	185	187
1	2	3	

Fig. 2.2

`theOrders[1,0]` would return 1

The following algorithm is written:

```

procedure x()
  finished = false
  count = 0
  while NOT(finished)
    if theOrders[1,count] == null then
      finished = true
    else
      output = theOrders[0,count]
      print(output)
      count = theOrders[1,count]
    endif
  endwhile
  output = theOrders[0,count]
  print(output)
endprocedure

```

(i) Outline why `nodeNo` does not need to be stored in the array.

.....
 [1]

(ii) Complete the trace table for procedure `x`, for the data shown in Fig. 2.2.

finished	count	output

[3]

(iii) Describe the purpose of procedure `x`.

.....

 [2]

3 An encryption routine reads a line of text from a file, reverses the order of the characters in the string and subtracts 10 from the ASCII value of each letter, then saves the new string into the same file.

The program is split into sub-procedures. Three sub-procedures are described as follows:

- Read string from file
- Push each character of the string onto a stack
- Read and encrypt each character message

(a) (i) Identify **one** further sub-procedure that could be used in the program.

..... [1]

(ii) Describe **two** advantages of splitting the problem into sub-procedures.

1

.....

.....

.....

2

.....

.....

..... [4]

(b) A function, readMessage:

- takes the file name as a parameter
- reads and returns the line of text

Complete the pseudocode algorithm for readMessage:

```
function ..... (fileName)
    messageFile = openRead(.....)
    message = messageFile.readLine()
    messageFile. ....
    return .....
endfunction
```

[4]

5 A recursive function, `calculate`, is shown below:

```
01 function calculate(num1, num2)
02     if num1 == num2 then
03         return num1
04     elseif num1 < num2 then
05         return calculate(num1, (num2-num1))
06     else
07         return calculate(num2, (num1-num2))
08     endif
09 endfunction
```

(a) Identify the lines where recursion is used.

..... [1]

(b) Trace the algorithm, showing the steps and result when the following line is run:

```
print (calculate (4, 10))
```

[5]

Section B

Answer **all** questions.

6 A software developer is creating a Virtual Pet game.

The user can choose the type of animal they would like as their pet, give it a name and then they are responsible for caring for that animal. The user will need to feed, play with, and educate their pet.

The aim is to keep the animal alive and happy, for example if the animal is not fed over a set period of time then the pet will die.

- The game tells the user how hungry or bored the animal is as a percentage (%) and the animal's intelligence is ranked as a number between 0 and 150 (inclusive).
- Hunger and boredom increase by 1% with every tick of a timer.
- When the feed option is selected, hunger is reduced to 0.
- When the play option is selected, bored is reduced to 0.
- When the read option is selected, the intelligence is increased by 0.6% of its current value.

An example of the game is shown:

```
What type of pet would you like? Fox or Elephant?  
Fox  
What would you like to name your Fox?  
Joanne  
Joanne's stats are  
Hunger: 56%  
Bored: 85%  
Intelligence: 20  
What would you like to do with your pet? Play, Read or Feed?
```

Fig. 1.1

(a) Identify **three** inputs that the user will have to enter to start, and/or play the game.

- 1.....
- 2.....
- 3.....

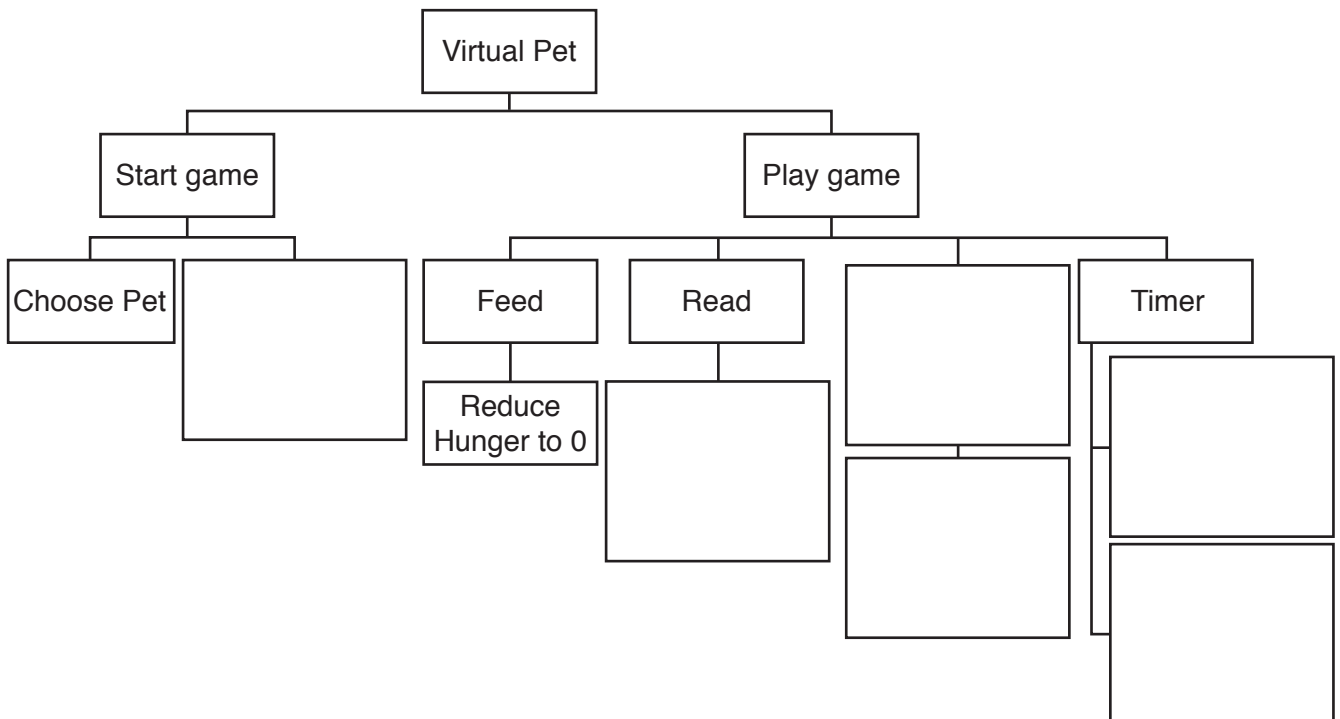

[3]

(b) The developer is using decomposition to design the game.

(i) Describe the process of decomposition.

.....
.....
.....
..... [2]

(ii) The developer has produced the following structure diagram for the game:

Complete the structure diagram for the Virtual Pet game by filling in the empty boxes.

[6]

(c) The developer needs to write procedures for the options play and read. Each of the options changes its corresponding value, and outputs the results to the screen.

(i) Write a procedure, using pseudocode, to reset `bored` and output the new value in an appropriate message.

.....
.....
.....
.....
.....
..... [3]

(ii) Write a procedure, using pseudocode, to increase `intelligence` by 0.6% and output the new intelligence in an appropriate message.

.....
.....
.....
.....
..... [3]

- (d) The developer is extending the game to allow users to have multiple pets of different types. The developer has written a class, `Pet`.

The attributes and methods in the class are described in the table:

Identifier	Attribute/Method	Description
<code>petName</code>	Attribute	Stores the pet's name
<code>bored</code>	Attribute	Stores the % bored
<code>hunger</code>	Attribute	Stores the % hunger
<code>intelligence</code>	Attribute	Stores the intelligence
<code>type</code>	Attribute	Stores the type of animal
<code>new</code>	Method	Creates a new instance of <code>pet</code>
<code>feed</code>	Method	Reduces <code>hunger</code> to 0 and outputs <code>hunger</code>
<code>play</code>	Method	Reduces <code>bored</code> to 0 and outputs <code>bored</code>
<code>read</code>	Method	Increases <code>intelligence</code> by a set value
<code>outputGreeting</code>	Method	Outputs a message to the user

Part of the class declaration is given:

```
class Pet
    private petName
    private bored
    private hunger
    private intelligence
    private type
    ...
    ...
```

(f) The developer is storing the user's pets in a 1-dimensional array. At each timer interval, the array is searched, using a linear search, to check if any pets' hunger or bored values are greater than 90%. If they are, an alert is displayed to the user.

(i) State the complexity of searching the pets in Big-O notation.

..... [1]

(ii) A given computer takes 4 milliseconds (ms) to search an array of 20 pets. Calculate an estimate of how long the computer will take to search an array of 100 pets.

Show your working.

.....
.....
..... [2]
